Lecture 5-2

Pandas: Indexing, Arithmetic, Missing Values

Week 5 Wednesday

Miles Chen, PhD

Based on Wes McKinney's Python for Data Analysis and the Pandas Documentation

```
import numpy as np
import pandas as pd
```

Series that we will use as examples

```

Reindexing

Reindexing is different from just defining a new index.

Reindexing takes a current Pandas object and creates a *new* Pandas object that *conforms* to the specified index.

Do not confuse reindexing with creating a new index for a dataframe object.

Reindexing

Reindexing is different from just defining a new index.

Reindexing takes a current Pandas object and creates a *new* Pandas object that *conforms* to the specified index.

Do not confuse reindexing with creating a new index for a dataframe object.

.reindex() vs .loc()

If you don't need to fill in any missing info, then .reindex() and .loc() work very similarly. If the new index will have values that don't exist in the current index, you need to use reindex.

.reindex() vs .loc()

If you don't need to fill in any missing info, then .reindex() and .loc() work very similarly. If the new index will have values that don't exist in the current index, you need to use reindex.

In [101]: df.T

Out[101]: one 1.5 6.0 NaN 1.5 4.0 6.0 NaN
two NaN -4.5 NaN -1.5 0.0 -4.5 4.0 In [101]: df.T

Out[101]: a b c d e f g

one 1.5 6.0 NaN 1.5 4.0 6.0 NaN

two NaN -4.5 NaN -1.5 0.0 -4.5 4.0

In [102]:

apparently you can only fill missing values with dictionaries/series over a column
so we have to do some Transpose magic
df.T.fillna(df.T.mean()).T

Out[102]:

	one	two
а	1.5	1.5
b	6.0	-4.5
С	NaN	NaN
d	1.5	-1.5
е	4.0	0.0
f	6.0	-4.5
g	4.0	4.0

dealing with duplicates

dealing with duplicates

```
In [103]: df

Out[103]:  

| One | two | | |
| a | 1.5 | NaN | |
| b | 6.0 | -4.5 | |
| c | NaN | NaN | |
| d | 1.5 | -1.5 | |
| e | 4.0 | 0.0 | |
| f | 6.0 | -4.5 | |
| g | NaN | 4.0 |
```

dealing with duplicates

```
In [103]:
             df
               one
Out[103]:
                1.5 NaN
